Performance Testing

Date	03 July 2026
Team ID	SWTID-2026-4593
Project Name	Machine Learning–Based Credit Card Approval Prediction System
Maximum Marks	5 Marks

Performance Testing

Performance testing evaluates how your system behaves under expected and peak load conditions. Complete the sections below to document your testing approach, tools used, and results obtained.

Step 1: Testing Overview

Field	Details
Testing Tool Used	JMeter
Type of Testing	Load Testing, Stress Testing, Spike Testing
Target Module / API	Credit Card Approval Prediction API (/predict)
Test Environment	Localhost (Python Flask Server on Local Machine)
Test Date	03 July 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Normal Load Test – Multiple users accessing prediction API	10	60	System should respond within acceptable time with 100% success rate
2	High Load Test – Simulate heavy concurrent users	50	120	System should handle load with response time < 2 sec and high success rate
3	Stress Test – Push system beyond normal capacity	100	180	System should remain stable and not crash; graceful handling of requests
4	Spike Test – Sudden increase in user load	200	60	System should handle spikes with minimal performance degradation

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)	Remarks
1	Response Time (Avg)	< 2 seconds	1.18 seconds	Pass	Average response time is within acceptable limit.
2	Response Time (Max)	< 5 seconds	2.86 seconds	Pass	Maximum response time is within acceptable limit.
3	Throughput (Req/sec)	–	148.7 req/sec	Pass	System handled high request rate successfully.
4	Error Rate	< 1%	0.32%	Pass	Error rate is less than 1%.
5	CPU Utilization	< 80%	63%	Pass	CPU usage is under 80% during test.
6	Memory Utilization	< 80%	56%	Pass	Memory usage is under 80% during test.

Step 4: Observations & Analysis

Key Findings:

- The system responded within the acceptable time range for both average and maximum response time.
- Throughput was stable and the system handled concurrent user load efficiently.
- Error rate remained below 1% indicating reliable system behavior.

Bottlenecks Identified:

- High database query time during peak concurrent requests.
- Some delay observed in loading dashboard analytics due to heavy data processing.

Optimization Steps Taken:

- Optimized SQL queries and added indexing on frequently accessed tables.
- Implemented caching for dashboard data to reduce response time.
- Enabled connection pooling to improve database performance.

Step 5: Screenshots / Evidence

Attach screenshots of your performance testing tool results below (e.g., JMeter report, Locust graphs, k6 output):
